

```
root@server:~# ./easyrsa sign req server
Note: using Easy-RSA configuration from: ./vars
Using SSL: openssl OpenSSL 1.0.2k-fips 26 Jan 2017

You are about to sign the following certificate.
Please check over the details shown below for accuracy. Note that this request
has not been cryptographically verified. Please be sure it came from a trusted
source or that you have verified the request checksum with the sender.

Request subject, to be signed as a server certificate for 3650 days:
-----
subject=
  commonName = server

Type the word 'yes' to continue, or any other input to abort.
Confirm request details: yes
Using configuration from /etc/openvpn/easy-rsa/3/pki/safesl-easyrsa.cnf
Enter pass phrase for /etc/openvpn/easy-rsa/3/pki/private/ca.key:
CHECK that the request matches the signature
Signature ok
The Subject's Distinguished Name is as follows
commonName            :ASN.1 12:'server'
Certificate is to be certified until Sep 28 04:30:05 2029 GMT (3650 days)

Write out database with 1 new entries
Data Base Updated

Certificate created at: /etc/openvpn/easy-rsa/3/pki/issued/server.crt
```

jpTables nStep 6 - Install Firefox. p0f nStep 7 - Set Firewall rules Usage It is easy to set up and easy to use, saving you hours of frustration. Just add the path to the easy-rsa directory to your system path (e.g. /usr/local/sbin/easy-rsa-install.sh) and follow the instructions. Current Releases See the Easy-RSAs online help for the latest versions. Each spring, farmers and other gardeners alike discover that the wide variety of seeds and plants that grow in the soggy fields and marshes can be easily transported with ease and minimal damage by using seed packets or seed baskets to hold the seeds and plants together. However, current seed packaging material does not provide much protection of the plants or seeds during shipment and storage in the field. Accordingly, there is a need for a container system that can be used for seed and plant transportation, as well as for seed storage that can protect the plants from damage while they are being stored and transported. In addition, there is a need for a seed container system that can easily and quickly be erected and taken down. This invention relates generally to the fabrication of semiconductor devices, and more specifically to the formation of shallow trench isolations in a semiconductor substrate. Device isolation structures in semiconductor substrates are used to physically and electrically separate devices formed in the substrate. Typically, device isolation structures are formed by etching trenches in the substrate, which is typically a silicon substrate. Polysilicon is then deposited in the trenches and subsequently converted to a silicon oxide material, e.g., by a high temperature oxidation step. The resulting oxide liner is densified and partially recessed by the application of heat, after which the oxide liner is refilled with an insulating material, such as a spin-on-dielectric (SOD) material. In forming shallow trench isolation (STI) regions, the SOD material and the oxide liner typically require a high temperature bake (i.e., to drive off residual solvent) to ensure adequate bonding of the materials. Unfortunately, during this high temperature bake, the liner in the STI region is significantly affected, which may lead to loss of its function. The present invention is directed to overcoming one or more of the problems set forth above. In one aspect of the present invention, a method of forming a shallow trench isolation region is provided.
